AMAKA'S MEGA MART

SALES PERFORMANCE ANALYSIS REPORT

Project focus: Sales revenue, profitability, product and category performance, monthly trends, geographical distribution, payment methods, and salesperson revenue.

Prepared by

Abdulmuiz Abdulazeez Arikewushola

Data Analytics Portfolio Project

1. Executive Summary

This report examines the sales performance of Amaka's Mega Mart, a Nigerian retail business dealing in electronics, accessories, and furniture across multiple locations. An interactive Excel dashboard was developed to turn the available sales records into a concise view of business performance and areas that may require management attention.

The dataset covers five months, from January to May, and contains 45 orders. It records total revenue of ■**40,249,900**, total profit of ■**8,655,900**, and **559 units** sold. Electronics is the largest revenue-generating category, Lagos is the leading city, and May records the highest monthly revenue.

The dashboard is descriptive: it highlights patterns and raises useful business questions. It does not, on its own, establish why a trend occurred or prove that one factor caused another.

Headline performance

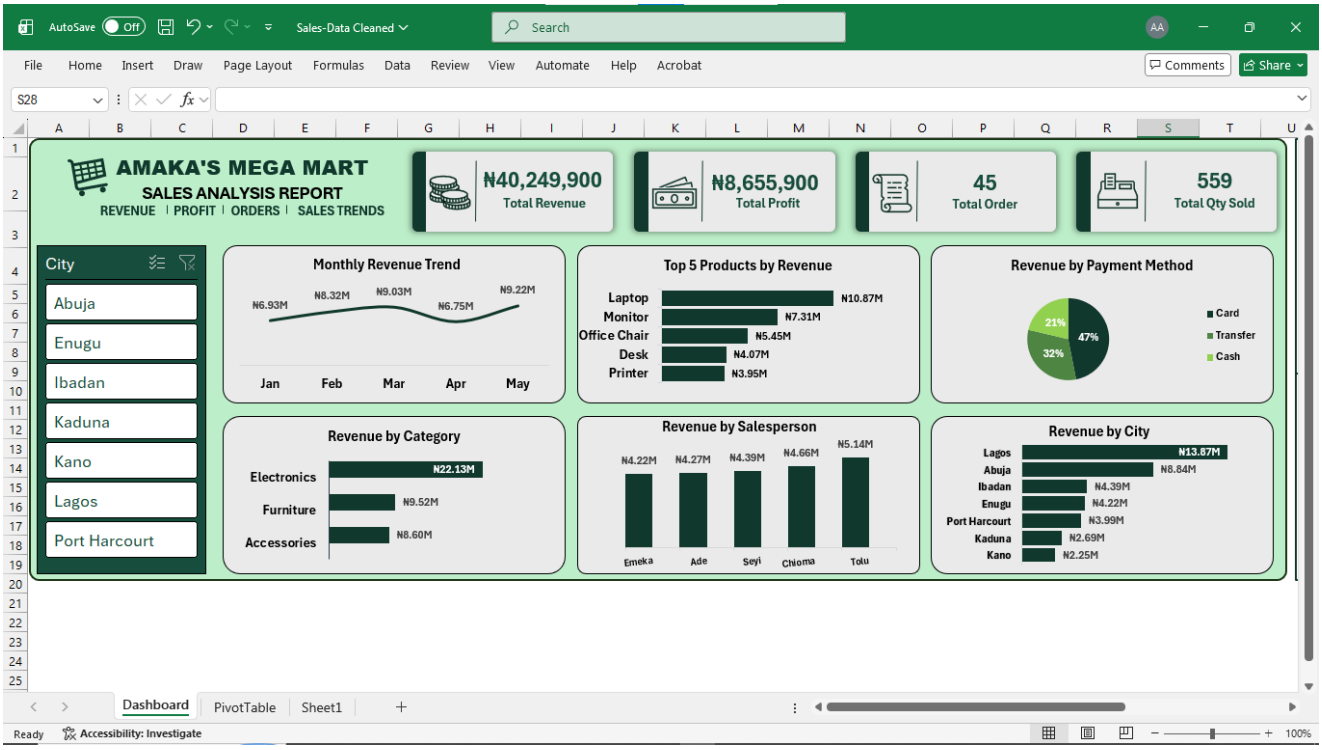

TOTAL REVENUE	TOTAL PROFIT	ORDERS	QUANTITY SOLD
■40.25M	■8.66M	45	559

The reported profit is approximately 21.5% of revenue (profit divided by revenue). This is a simple ratio based on the figures provided; it should not be treated as a complete net profit margin unless all relevant business expenses are included.

2. Dashboard Overview

The dashboard combines summary cards with charts for monthly revenue, top products, payment methods, category revenue, salesperson revenue, and city-level revenue. A city slicer allows the viewer to filter the report by location and explore how the displayed measures change.

The screenshot below is the dashboard preview used for this report.

3. Key Findings and Analysis

3.1 Overall Sales Performance

The dashboard records total revenue of ■40,249,900, total profit of ■8,655,900, 45 orders, and 559 units sold. These figures provide a high-level view of activity during the period covered. The positive difference between revenue and reported profit indicates that the dataset records a positive profit contribution, although the cost and expense definitions should be confirmed before interpreting it as overall business profitability.

3.2 Product Category Performance

Category	Revenue	Interpretation
Electronics	■22.13M	Largest category contributor.
Furniture	■9.52M	Second-largest contributor.
Accessories	■8.60M	Lowest of the three categories.

Electronics generates approximately 55% of total revenue, making it the strongest category in the period. Management could examine the products and customer segments driving this result, while assessing whether targeted promotions, improved product visibility, or complementary offers could strengthen Furniture and Accessories.

3.3 Top-Selling Products

Product	Revenue
Laptop	■10.87M
Monitor	■7.31M
Office Chair	■5.45M
Desk	■4.07M
Printer	■3.95M

Laptops lead the displayed top-five products by revenue, followed by monitors and office chairs. These products merit attention when reviewing stock availability and customer demand. Revenue alone, however, does not establish which products are most profitable; management should also consider unit cost, gross margin, stock turnover, and returns.

3.4 Monthly Revenue Trends

Month	Revenue	Observation
January	■6.93M	Starting point for the period.
February	■8.32M	Revenue increased.
March	■9.03M	Continued increase.
April	■6.75M	Lowest month; notable decline.
May	■9.22M	Highest month; recovery.

Revenue rose from January through March, declined in April, and recovered in May to the highest monthly figure. April's decline warrants further investigation. Possible areas to examine include product availability, customer

demand, pricing, promotions, staffing, and the timing of large orders. The available chart does not identify the cause of the decline.

3. Key Findings and Analysis (continued)

3.5 Geographical Sales Performance

City	Revenue
Lagos	■13.87M
Abuja	■8.84M
Ibadan	■4.39M
Enugu	■4.22M
Port Harcourt	■3.99M
Kaduna	■2.69M
Kano	■2.25M

Lagos is the leading city-level revenue contributor, followed by Abuja. The business could investigate differences in customer demand, product mix, order size, and market coverage across locations. Successful practices in Lagos may offer ideas for other cities, but expansion decisions should also account for local demand and operating costs.

3.6 Revenue by Payment Method

Card payments account for 47% of revenue, transfers account for 32%, and cash accounts for 21%. Card and transfer together represent approximately 79% of revenue. This suggests that electronic payment channels are important to the business. Management should maintain reliable card and transfer options while continuing to serve customers who prefer cash.

3.7 Revenue by Salesperson

Salesperson	Revenue shown
Tolu	■5.14M
Chioma	■4.66M
Seyi	■4.39M
Ade	■4.27M
Emeka	■4.22M

Tolu records the highest revenue among the five salespersons shown, followed by Chioma. The chart can help management identify differences in recorded revenue and guide further review. Fair performance comparisons should also consider sales targets, working hours, customer allocation, product mix, and profit contribution.

Data reconciliation note: The five salesperson values displayed add up to approximately ■22.68M, which is below the overall revenue of ■40.25M. The chart may represent only a subset of sales, or its underlying calculation may need checking. Confirm the PivotTable/filter settings and salesperson assignments before treating the chart as a complete breakdown of company revenue.

4. Key Business Recommendations

1. Protect strong revenue contributors. Monitor stock availability, customer demand, and margins for laptops, monitors, and other leading products. Consider complementary product bundles where they make commercial sense.

2. Investigate the April decline. Compare April transactions with the surrounding months. Review stock-outs, pricing changes, promotional activity, staffing, order sizes, and customer demand before selecting corrective

actions.

3. Learn from the Lagos market. Examine the factors behind Lagos's leading revenue contribution and assess which sales practices could be adapted to Abuja and the other markets. Consider operating costs and local demand before committing resources.

4. Strengthen Furniture and Accessories. Review category-level margins and customer purchasing patterns. Test targeted promotions, improved product visibility, and relevant add-on offers to encourage category growth.

5. Use balanced salesperson measures. Combine revenue with profit, targets, working hours, customer allocation, and product mix when reviewing individual performance.

6. Maintain effective payment channels. Ensure card and transfer options are reliable, given their combined share of approximately 79% of revenue, while retaining cash as an available option.

5. Assumptions and Limitations

• The analysis uses the figures visible in the supplied dashboard and the accompanying project description. The underlying workbook was not independently audited as part of preparing this report.
• The dataset covers 45 orders over five months (January–May); the results describe this dataset and should not automatically be generalised to other periods.
• Profit is reported as ■8,655,900. The precise cost definition and treatment of operating expenses should be confirmed before interpreting this as net profit.
• Revenue rankings do not necessarily indicate profit rankings. Product-level cost and margin data would be needed for a profitability comparison.
• The reasons for the April decline cannot be determined from the dashboard alone.
• The salesperson chart values displayed total approximately ■22.68M, which does not reconcile to the overall revenue of ■40.25M. This requires validation in the workbook before drawing complete conclusions from the salesperson comparison.
• Payment-method percentages are approximate as displayed in the dashboard.

6. Conclusion

The Amaka's Mega Mart dashboard provides a consolidated view of revenue, profit, order volume, quantity sold, product and category contributions, geographical performance, payment methods, salesperson revenue, and monthly trends.

The analysis shows that Electronics is the largest revenue-generating category, laptops lead the displayed product ranking, Lagos is the leading city, and May records the highest monthly revenue. April's decline and the salesperson chart's reconciliation gap are important areas for further investigation.

The value of the dashboard extends beyond presenting figures visually. It helps management identify patterns, ask better business questions, and focus further analysis on decisions that can improve performance. Additional transaction-level and cost data would strengthen future analysis.
